ABSTRACT

COVID-2019 has been recognized as a global threat, and several studies are being conducted in order to contribute to the fight and prevention of this pandemic. This work presents a scholarly production dataset focused on COVID-19, providing an overview of scientific research activities, making it possible to identify countries, scientists and research groups most active in this task force to combat the coronavirus disease. The dataset is composed of 40,212 records of articles' metadata collected from Scopus, PubMed, arXiv and bioRxiv databases from January 2019 to July 2020. Those data were extracted by using the techniques of Python Web Scraping and preprocessed with Pandas Data Wrangling. In addition, the pipeline to preprocess and generate the dataset are versioned with the Data Version Control tool (DVC) and are thus easily reproducible and auditable.

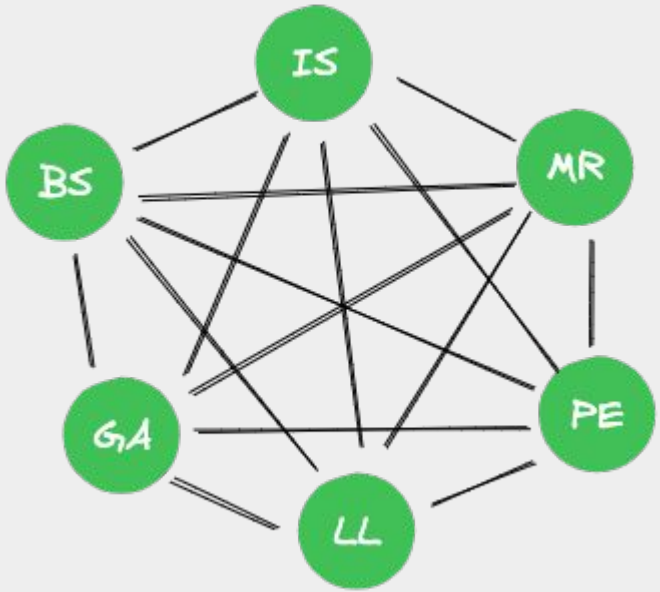
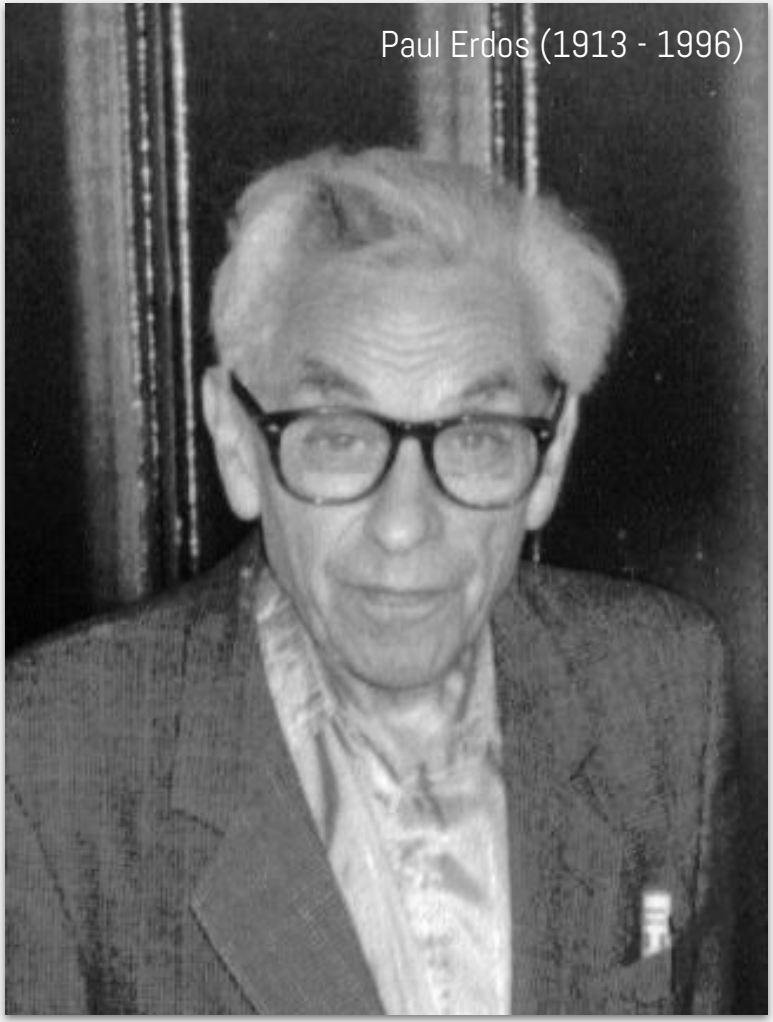
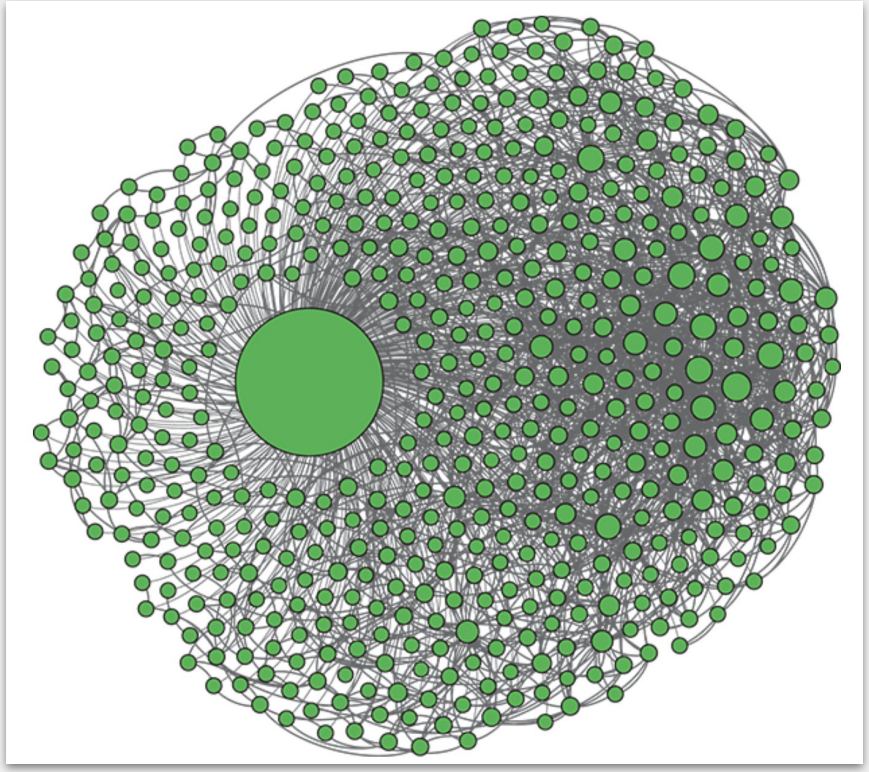
Coauthorship networks







Ego Network

Paul Erdős was a famous mathematician who made critical contributions to network science. Mathematicians are fond of studying their distance in the coauthorship network from the particular node corresponding to Erdős. They call this distance their **Erdős number** .

Boy Scouts of America → Sodium chloride

(4 minutes ago) ← →

#1.**TealDeer46**(2000pts)

WIN #1

Boy Scouts of America → New Mexico → Mining → Sodium chloride

(800PTS · 4CLICKS · 19SECS)

WIN #2

Boy Scouts of America → New Mexico → Economy of New Mexico → Manganese → Chlorine → Sodium chloride

(1200PTS · 6CLICKS · 82SECS)

#2.**CrimsonChinchilla37**(600pts)

Breadth-First Search (BFS) vs Depth-First Search (DFS)

Visited Nodes

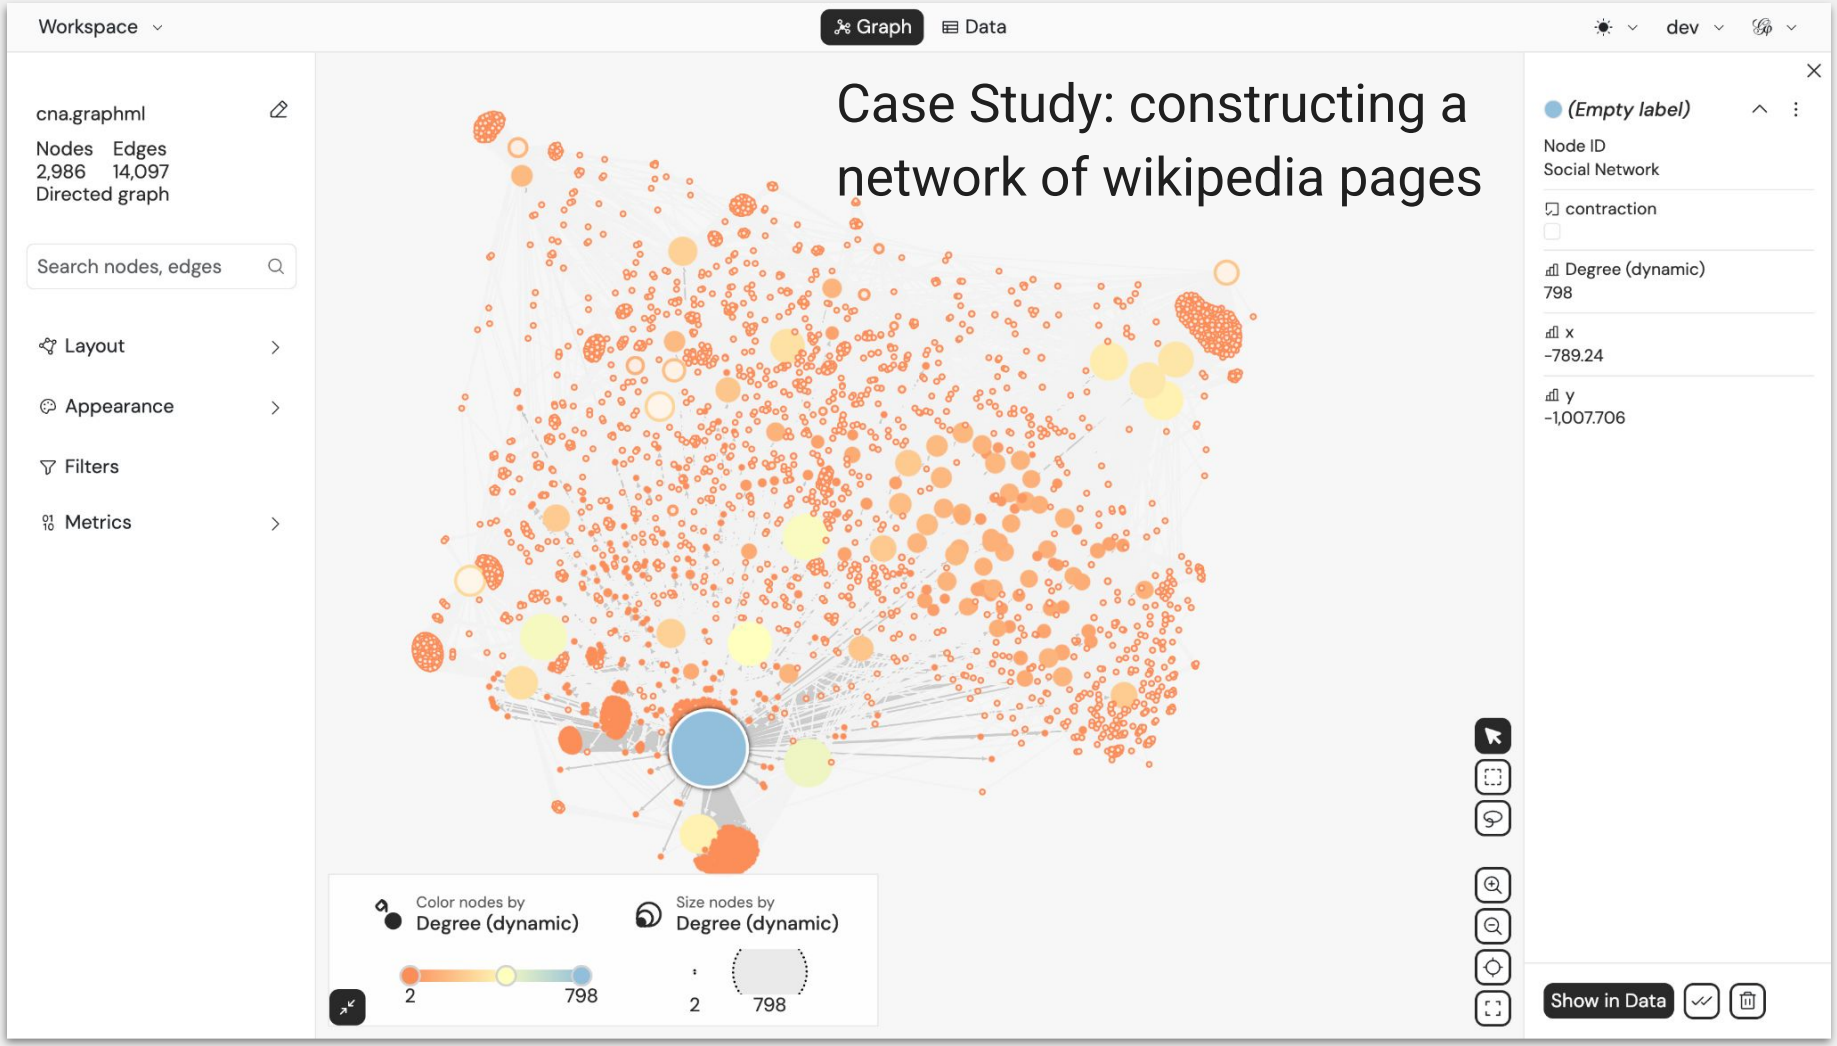
BFS vs DFS

Graph Transversal & WikiGame

	Breadth-First Search (BFS)	Depth-First Search (DFS)
Exploration strategy	Level-by-level (layered expansion)	Goes deep along one path before backtracking
Data structure	Queue (FIFO)	Stack / Recursion (LIFO)
Goal guarantee	Finds shortest path	Does not guarantee shortest path
Time complexity (algorithm)	O(V + E)	O(V + E)
Space complexity (algorithm)	O(V) (stores frontier)	O(h) (depth of search, worst-case O(V))
Branching factor (d)	Expands all neighbors at each level	Expands only one branch at a time
Frontier growth	O(d^k) (exponential in depth k)	O(d · k) (linear in depth)
Memory usage	High (stores full layer)	Low (stores path only)
Risk	Memory explosion	Deep/unproductive paths
Best use cases	Shortest path, minimum hops	Exploration, large/deep graphs


Case Study: constructing a network of wikipedia pages
